Mobile Device Management: iOS

Rapid deployment of iOS™ devices in conformance with NCSC End User Device Security Guidance for OFFICIAL data.

Becrypt has developed an iOS Mobile Device Management (MDM) solution to meet the specific requirements that are unique to UK Government, wider public sector and security conscious commercial organisations. We have simplified the process of deploying iOS devices whilst vastly reducing management overhead.

Becrypt iOS MDM allows full device policy enforcement and through-life management, integrated with centralised Mobile Application Management (MAM), allowing corporately owned mobile devices to deliver maximum business value with managed and minimised risk.

Optimised Provisioning Tools

Streamlining the process of preparing and supervising an iOS device in a Known Good State, Becrypt iOS MDM reduces the time taken to configure and deploy a device from hours to minutes.

Easy Certificate Management

Integration with Active Directory™ and Microsoft™ CA services mean administrators can request and deploy Active Sync, VPN and device certificates for multiple users at the click of a button.

Pre-Configured Policy Option

Save time configuring multiple policy options by applying the recommended policy for OFFICIAL usage to all devices, or configure your own policy based on the risk appetite of your organisation.

Remote Lock and Wipe Functionality

As users report a device lost or stolen, send the device a Wipe instruction over the air (OTA) to protect against the loss of sensitive data.

App Management and Deployment

Although the App Store™ can be blocked for users, new apps and app updates can be pushed to the device. Users can then select and install the pre-approved apps via Becrypt Hub. This is integrated with the Volume Purchase Program (VPP) which simplifies how organisations buy and distribute apps in bulk.

Remote Password Reset

Users who forget their passwords can be sent a password reset message that unlocks the phone and forces them to enter a new password.
